

# GitHub Actions for Azure

Deliver software faster and more securely by combining the practices and tools that support the largest developer community in the world with seamlessly integrated Microsoft Azure products and services.

## Automate code-to-cloud workflows

Easily automate your code-to-cloud workflows on any GitHub event and deploy apps to Azure across popular languages and frameworks—including .NET, Node.js, Java, PHP, Ruby, and Python.

## Operate and manage seamlessly

Enable seamlessly automated IT management (GitOps) that is controllable, collaborative, and repeatable at enterprise scale.

## Shift security and compliance left

Automate security and compliance earlier in the software development lifecycle and write infrastructure configurations, release pipelines, and security policies “as code.”

## Accelerate developer velocity

Significantly reduce ramp-up time, avoid frequent context switching, and help teams be more productive with built-in extensions into Visual Studio Code, Azure CLI, and Azure Portal.
